In the interest of creating a more secure and convenient e-mail environment at Northwestern, NUIT is phasing out its existing password technology (Kerberos) on NU’s central e-mail servers (casbah, hecky, lulu, and merle). All e-mail users must upgrade and/or reconfigure their e-mail software for SSL (Secure Sockets Layer) before January 2005. After this date, anyone not using SSL will be unable to access their e-mail.

Our records indicate you are not using SSL for e-mail password authentication. Please upgrade or reconfigure your e-mail software *as soon as possible* to assure compatibility with SSL, using the following instructions.

- If you use Eudora for Windows or Macintosh, click the following link for instructions on how to change your settings:
  http://www.it.northwestern.edu/e-mail/config/krbssl-eudora.html

  (Please note: For SSL to run correctly with Eudora, you need Eudora 5.2 or above on Windows 2000/XP, or Eudora 6.0 on Macintosh OS 10.2 or above.)

- If you use Outlook or Entourage on Windows or Mac computers, click the following link for instructions on how to change your settings:
  http://www.it.northwestern.edu/e-mail/config/ssl-outlook.html

- If you use Apple Mail, click the following link for instructions on how to change your settings:
  http://www.it.northwestern.edu/e-mail/config/ssl-mail.html

- If you use WebMail for all of your e-mail, you do not need to make any changes.

If you have questions, please call the NUIT Support Center at 847-491-HELP (4357), e-mail consultant@northwestern.edu, or speak with your local technical support person.
